
Day 4

Tasks

1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

GPU Identification

You can identify the GPU without opening the laptop/desktop.

On Windows:

1. Press Windows + X.
2. Select Device Manager.
3. Expand Display adapters.
4. Note the GPU model shown there.

You can also press **Ctrl + Shift + Esc** → **Performance** → **GPU** to see the installed GPU.

Information	Answer
GPU Brand	Intel
GPU Model	Intel(R) UHD Graphics
Type	Integrated

Day 4

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

SPARKX CUSTOMIZED DESKTOP

AIR COOLING SYSTEM

Air Cooler Specs

- Cooler Type:** Dual-Tower Heatsink
- Fan Count:** 2x 120mm PWM Fans (e.g., 1800 RPM)
- TDP Rating:** 250W+ (e.g., for i9/Ryzen 9)
- Noise Level:** 18-28 dBA
- Base Material:** Copper with Aluminum
- Heatpipes:** 6x 6mm Copper Heatpipes
- Dimensions:** ~165x150x135mm

Simple, Reliable, No Risk of Leaks

LIQUID COOLING SYSTEM (AIO)

High Efficiency, Quiet Under Load, Aesthetic

Liquid Cooler Specs

- Radiator Size:** 360mm (e.g., 3x 120mm Fans)
- Pump Type:** High-Performance PWM Pump
- TDP Rating:** 300W+ (e.g., Overclocking Ready)
- 3x 120mm PWM Fans** (e.g., 2000 RPM)
- Cold Plate:** Micro-Skived Copper
- Tubing:** Braided FEP
- Total Noise Level:** 20-35 dBA (varies with load)

CALL ME: 9030453343

Day 4

3.Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Air Cooling vs Liquid Cooling for GPUs

Factor	Air Cooling	Liquid Cooling
Cooling method	Uses heatsinks and fans to remove heat from the GPU.	Uses a liquid coolant, pump, water block, and radiator to transfer heat away.
Cost	Generally cheaper and included with most GPUs.	Generally more expensive because of the additional components.
Cooling efficiency	Good for normal gaming and everyday workloads.	Usually provides better heat dissipation, especially under sustained heavy workloads.
Noise	Fans can become noisy when the GPU is under heavy load.	Can be quieter in some setups because heat is moved to a larger radiator, although pumps and radiator fans still make noise.
Maintenance	Low maintenance; mainly requires cleaning dust from fans and heatsinks.	Higher maintenance; requires checking the pump, tubing, radiator, and coolant system.
Installation	Simple and easy to install.	More complicated and requires careful installation.
Risk	Very low risk because there is no liquid.	Liquid leaks are a potential risk, particularly with poorly installed or damaged systems.
Best suited for	Most gaming PCs, office PCs, and general-purpose systems.	High-performance systems, extreme workloads, or users who prioritize advanced cooling.

Day 4

4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

I would prefer to go with Liquid cooling system for GPU rather than Air cooling and the reason is

Why Choose Liquid Cooling for the GPU?

Step 1 – Better Heat Dissipation:

Liquid cooling transfers heat away from the GPU more efficiently than traditional air cooling, which helps keep the GPU temperature lower.

Step 2 – Suitable for Heavy Gaming:

Graphics-heavy games put a lot of loads on the GPU and generate significant heat. Liquid cooling helps manage this heat during long gaming sessions.

Step 3 – Better for Long Streaming & Gaming:

When streaming IPL matches while gaming or performing other demanding tasks, the GPU may remain under load for extended periods. Liquid cooling helps maintain more stable temperatures during these continuous workloads.

Step 4 – Quieter Operation:

Liquid cooling can reduce the need for GPU fans to run at very high speeds, which can result in quieter operation compared with an air-cooled setup under heavy load.

 **Final Answer**

I would choose liquid cooling for my GPU because it provides better heat dissipation and keeps the GPU temperature lower during heavy workloads. It is especially suitable for graphics-heavy games and long gaming sessions where the GPU generates a lot of heat. Liquid cooling also helps maintain stable performance and can provide quieter operation during extended gaming and streaming. Therefore, liquid cooling is a good choice for a high-performance gaming PC used for streaming IPL matches and playing demanding games.
